

ABSTRACT OF THE DISCLOSURE

A system and method for pushing information from a host system to a mobile data
communication device upon sensing a triggering event is disclosed. A redirector program
operating at the host system enables a user to continuously redirect certain user-selected data
items from the host system to the user's mobile data communication device upon detecting that
one or more user-defined triggering events has occurred. The redirector program operates in
connection with event generating applications and repackaging systems at the host system to
configure and detect a particular user-defined event, and then to repackage the user-selected data
items in an electronic wrapper prior to pushing the data items to the mobile device.
